

ALBATROZ ENGENHARIA NEWS

DOA Competences and extension of scope of work

Albatroz Engenharia has approved last month a minor change for GAir II Maintenance in Portugal. This approval is another accomplished step of our strategy and approach to provide services in the General Aviation market (CS-23).

Our DOA core competencies are in the integration and development of mission equipment (payloads). But because competencies are similar, we have decided to provide support to our customer in dealing with systems obsolescence, avionics upgrades or cabin interior refurbishment.

The CS-23 is inevitably a complement of our strategy, not only to perform minor changes but also to integrate payloads on fixed-wing aircraft, which is something that we have been working on.

We took this step further in extending our scope of work to offer our clients the possibility of choosing the most suitable and cost-effective platform to perform aerial surveys.

We are committed to providing the best solution to support the needs and the most demanding requests of each client, with a quick response and cost-effective solutions approach.
